

- I1: I see. from your point of view, what is sustainability in terms of software?
- P: Um, so I guess it means ensuring your software can be used in the future, so after you've stopped developing it, then some kind of plan to maintain it or allow the people to develop it. And also for them to be able to use it.
- I1: Um, which attributes or features the software has that makes you believe that it is sustainable?
- P: Um, so it needs to be well documented, preferably with tests that can be run. It needs to be in a somewhere accessible so it's part of source control gitHub.
- I1: Hmm.
- P: Um. Maybe make use of dependencies that are maintained, so like libraries and things like that.
- I1: Any other features of the code or the project?
- P: Um, so obviously you need to write nice modular code, well I think that's a given in any kind of software development. Yeah.
- I1: Uh, regarding the software that you developed, was sustainability a consideration?
- P: Um, I don't think it was a primary consideration, um, but it is becoming more important now that I, um, a lot of our projects are coming to an end and we need to make a plan for them to be maintained in the future. Um, so with my experiment we ... We've, uh, moved it to various source control locations, so it's original on a website called Name01, that got shut down so we had to move everything over to get gitHub so people could still access it when Name01. Yeah.
- I1: So was sustainability a consideration since the beginning or was it discussed after some point in time?
- P: Yeah I don't think it was a consideration at the start, I think at the start it was more about getting things done, getting things ready, so yeah it's more of a thing that's come about as the project has come along.
- I1: I see, how, how much time would you say that you took?

P: Um, well I wasn't working on um most of these projects when they started, so I'm not really sure but I'd say maybe a year or two.

I1: Um, have you worked on any projects that were not sustainable?

P: Um, well I guess that's hard to say because I'm kind of still working on all the projects that I've ever worked on, so, um, I don't think so.

I1: Um, were, were there any consequences of it not being sustainable?

P: Um ... Well, no, not that I can think of.

I1: No?

P: No.

I1: Well that's all, okay, um, that's all I have for today.

P: Okay.

I1: Supposed to be really quick.

P: Cool.

I1: Alright.

P: Alright. Thanks a lot.

I1: I hope Person01 will bring the cake.

P: I wasn't here for the cake.

I1: Thank you, thank you.
